***Fleck's Lillies* Finest True Strain, Highest Bud Count, N. W., U.S.A. Grown**

Those who grow our brand of these fine Lilies, always reorder. There must be a reason. Croft Lilies are easy to grow by observing a few simple rules. Cultural directions sent with order or on request.

ACE—American Grown

Produce a smaller plant than does the Croft, also Ace foliage "points up", which means less bench room. Bud count is generally higher than that of a comparable sized Croft bulb. Slightly earlier than Croft.

HYBRID VARIETIES Unless Indicated As Inbred

Results of experiments indicate that by giving the small snap plants higher temperatures in first few weeks after transplanting, you can advance crop time by about three weeks.

Treatment of small seedlings for four weeks at 65° to 70°F immediately after transplanting will result in about three weeks earlier flowering.

It seems that for best growth, the optimum temperature for the small plants is 65° to 70°, whereas, as the plants get larger, the optimum temperature drops to about 50° to 55°.

Using the above method it was shown that not only did the plants flower earlier, but they also were larger, thus it cannot be said that the earlier flowering, occurred at the expense of leaf and stem growth.

Experiments have shown that earlier flowering occurs if temperature treatment is given during September, October, November and December than at any other time.

Seedlings planted earlier than September usually receive high temperature anyway, and those planted later than December flower rapidly during warm weather. Crop maturing late in December to early May benefited most.

Due to the precise timing necessary for year round production of Snaps, we have indicated the best flowering time for each variety by the letters as listed in the chart next column.

A. December, January	E. July, August, September
B. Feb., Mar., Early April	F. September, October
C. Late April, May	G. November
D. May, June
